Requirements

- PHP $\geq 7.0.0$
- OpenSSL PHP Extension
- PDO PHP Extension
- Mbstring PHP Extension
- Tokenizer PHP Extension
- XML PHP Extension

Laravel 5.7 requires PHP version 7.1.3 or more, and some other extensions. Since we are doing setup on XAMPP. Make sure to Install the XAMPP with version $\geq 7.2.0$.

Install XAMPP

First of all we need to download and install XAMPP. Download it from the [apache friends official website](#). Download the XAMPP version $> 7.2.0$. Download the version for OSX (Mac).

[Trade Now](#)

7.1.8 / PHP 7.1.8

Download (64 bit)

136 Mb

Follow the steps to install the XAMPP. If you are on MAC, the install location for XAMPP will be /Applications/XAMPP.

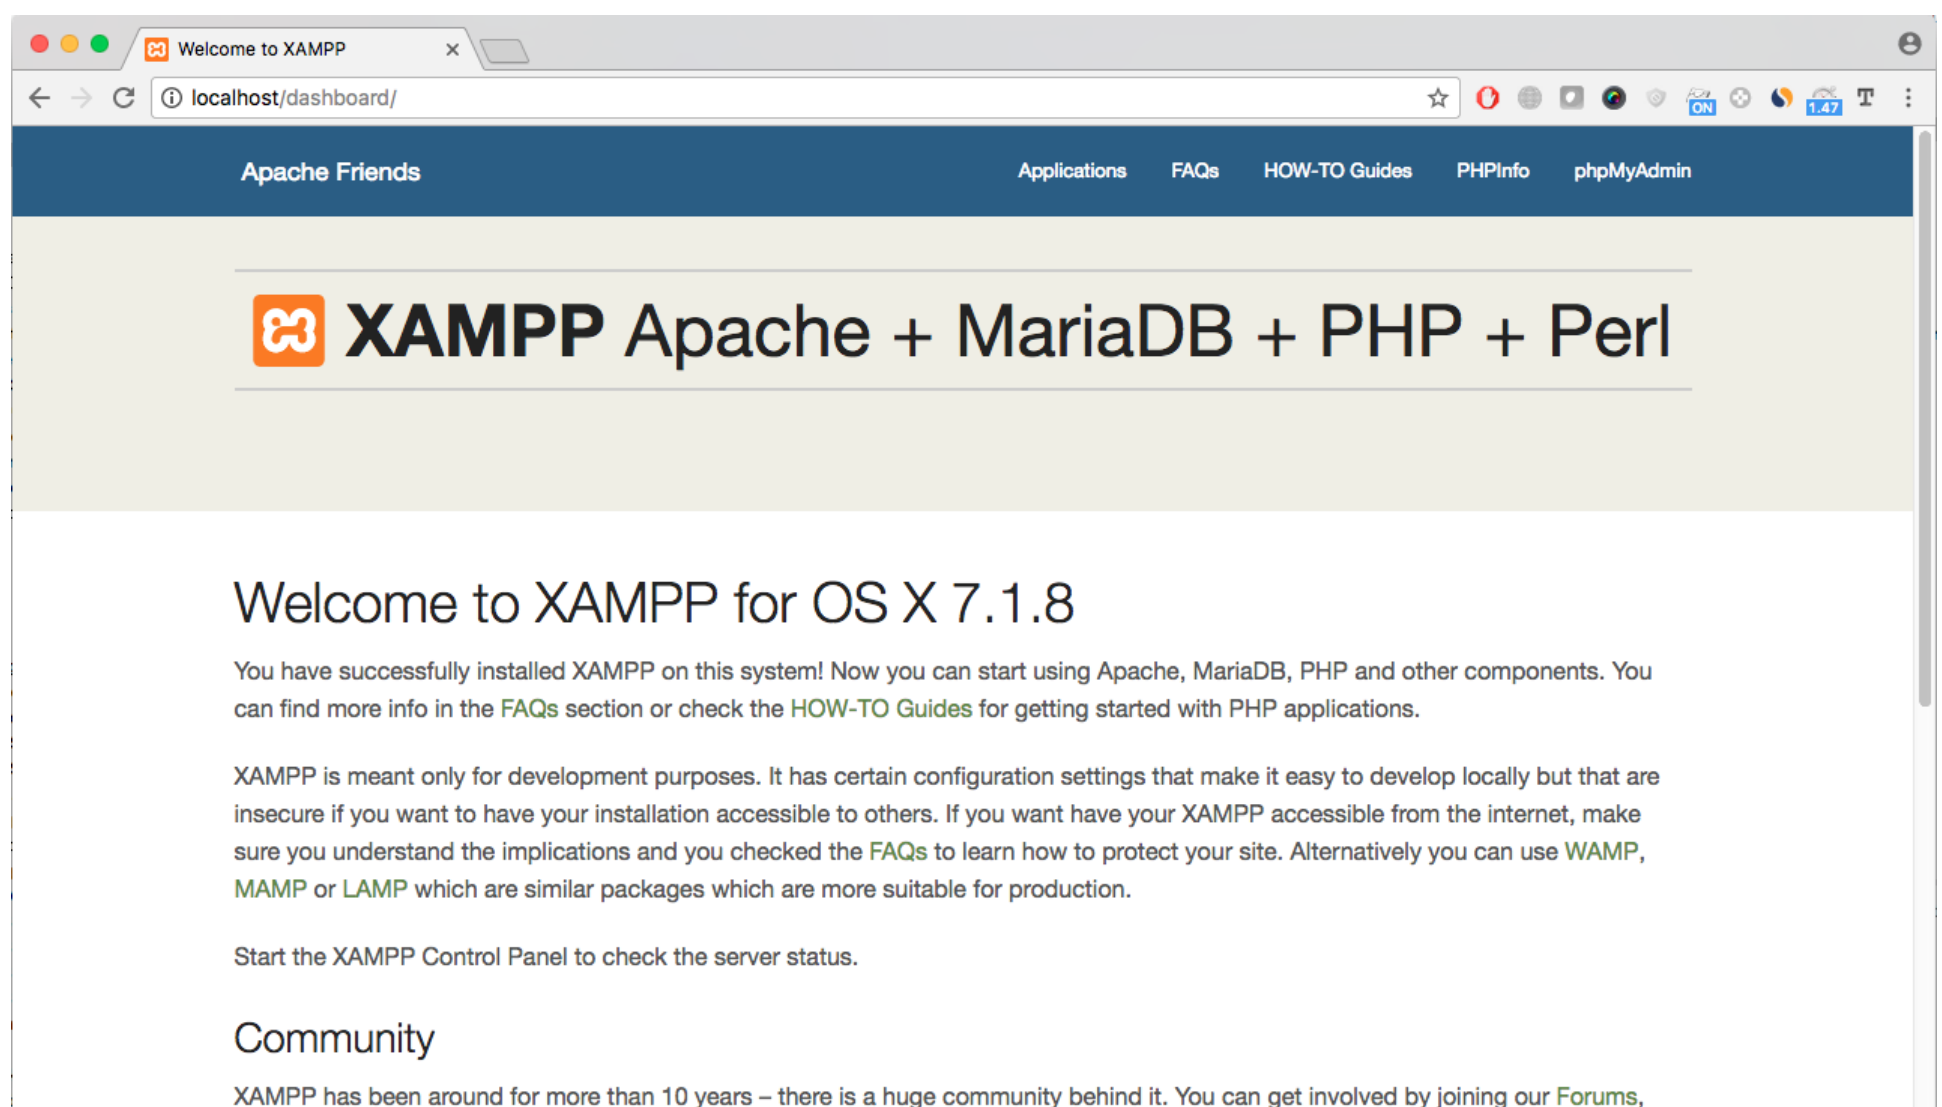

The screenshot shows the XAMPP 7.1.8-0 application window. The 'Manage Servers' tab is active. A table lists the status of three services: MySQL Database (Stopped), ProFTPD (Stopped), and Apache Web Server (Running). The Apache Web Server row is selected. To the right of the table are buttons for Start, Stop, Restart, and Configure. At the bottom of the window are buttons for Start All, Stop All, and Restart All.

Server	Status
MySQL Database	Stopped
ProFTPD	Stopped
Apache Web Server	Running

Start Stop Restart Configure

Start All Stop All Restart All

If you XAMPP is installed correctly and if you have the apache service running under it, you should see the following page when you access **localhost** on your browser.

Composer

After you have downloaded XAMPP, We need to install Composer.

Composer is a dependency management or package management tool which is integrated with Laravel Framework. Check by running **composer** command in your terminal if your system has composer already installed in it. If not you can install it by following the steps for OSX ([Installing Composer on OSX](#))

Composer version 1.5.2 2017-09-11 16:59:25

Usage:

command [options] [arguments]

Options:

-h, --help	Display this help message
-q, --quiet	Do not output any message
-V, --version	Display this application version
--ansi	Force ANSI output
--no-ansi	Disable ANSI output
-n, --no-interaction	Do not ask any interactive question
--profile	Display timing and memory usage information
--no-plugins	Whether to disable plugins.
-d, --working-dir=WORKING-DIR	If specified, use the given directory as working directory.
-v vv vvv, --verbose	Increase the verbosity of messages: 1 for normal output, 2 for more verbose output and 3 for debug

Install Laravel Framework

The default directory of XAMPP for installing or keeping PHP project is htdocs. Navigate to following directory in your terminal **/Applications/XAMPP/htdocs** and run following composer command to create a fresh Laravel 5.5 version

```
composer create-project laravel/laravel myProject "5.5.*"
```

After running this command composer should start downloading dependencies that are required to create the Laravel project.

```
[MacBook-Pro-2:htdocs tgugnani$ composer create-project --prefer-dist laravel/laravel pedsProject1
Installing laravel/laravel (v5.5.0)
- Installing laravel/laravel (v5.5.0): Downloading (100%)
Created project in pedsProject1
> @php -r "file_exists('.env') || copy('.env.example', '.env');"
Loading composer repositories with package information
Updating dependencies (including require-dev)
Package operations: 68 installs, 0 updates, 0 removals
- Installing vlucas/phpdotenv (v2.4.0): Downloading (100%)
- Installing symfony/css-selector (v3.3.9): Downloading (100%)
- Installing tijsverkoyen/css-to-inline-styles (2.2.0): Downloading (100%)
- Installing symfony/polyfill-mbstring (v1.5.0): Downloading (100%)
- Installing symfony/var-dumper (v3.3.9): Downloading (100%)
- Installing symfony/routing (v3.3.9): Downloading (100%)
- Installing symfony/process (v3.3.9): Downloading (100%)
- Installing symfony/http-foundation (v3.3.9): Downloading (100%)
- Installing symfony/event-dispatcher (v2.3.0): Downloading (100%)
```

> Illuminate\Foundation\ComposerScripts::postAutoloadDump
> @php artisan package:discover
Discovered Package: fideloper/proxy
Discovered Package: laravel/tinker
Package manifest generated successfully.
> @php artisan key:generate
Application key [base64:Yyr8Ws1SwJm7hp00ABClAXj/ZQwcbufPYW2h7tBsn7c=] set successfully.
```

When it finishes it will create a Laravel 5.5 project with following data structure.

Modify Directory Permissions

In the newly created Laravel Project we need to modify the directory permissions of certain directory otherwise we will get following error on accessing the project

The stream or file “laravel.log” could not be opened: failed to open stream: Permission denied.

- cd into your Laravel project.
- `sudo chmod -R 777 storage`
- `sudo chmod -R 777 bootstrap/cache`

XAMPP Virtual Host

We need to configure XAMPP Virtual Host to set the document root to correct directory of laravel project and to also assign a name to the project by which we will be accessing it in browser.

Navigate and open file /Applications/XAMPP/etc/httpd.conf file and uncomment the line that includes the virtual host file.

```
# Virtual hosts
```

```
Include etc/extra/httpd-vhosts.conf
```

Navigate and open file /Applications/XAMPP/etc/extra/httpd-vhosts.conf and include following Virtual host entry in this file.

```
# VirtualHost for LARAVEL.LOCAL

<VirtualHost laravel.local:80>
    DocumentRoot "C:\xampp\htdocs\myProject\public"
    ServerAdmin laravel.local
    <Directory "C:\xampp\htdocs\myProject">
        Options Indexes FollowSymLinks
        AllowOverride All
        Require all granted
    </Directory>
</VirtualHost>
```

With this entry our apache is listening to **laravel.local**, but we also have to edit our hosts file to include an entry for the new domain.

Edit file /etc/hosts and add following entry to that file.

```
127.0.0.1 laravel.local
```

Restart your apache and access laravel.local on your browser you should be able to see this screen.

Success !
